EDUCATION

Vishwakarma University

B.Tech in Computer Science (AI/ML)

Pune, India

Expected 2028

PROFILE

Backend and systems-focused student developer interested in Linux systems, automation, AI integration, and developer tooling. Enjoy building modular systems, workflow automation tools, and experimental AI-assisted applications.

PROJECTS

DaemonV | *Java, System Monitoring, CLI*

- Built a background Java daemon that monitors system activity and generates context-aware AI observations.
- Implemented idle detection, silent modes, behavior-based triggering, and lightweight CLI controls.
- Experimented with ambient AI systems focused on minimal interaction instead of notification-heavy assistants.

Sozo | *Python, CLI Automation, Workflow Systems*

- Developing a CLI productivity and workflow system for task management, repository tracking, and adaptive scheduling experiments.
- Focused on automation, lightweight workflows, and reducing manual project management overhead.
- Currently exploring adaptive scheduling and context-aware workflow nudging concepts.

MicroTask Nudge | *Python, Local Automation, AI Integration*

- Built a low-pressure productivity assistant that suggests small adaptive micro-tasks instead of aggressive productivity tracking.
- Implemented behavior-aware timing, reflective memory features, and optional AI-generated responses.
- Designed around minimal interruptions, anti-burnout principles, and local-first usage.

HostelOps | *Python, Streamlit*

- Built a hostel issue-tracking platform where students can submit complaints with proof images and admins can verify and track resolutions.
- Implemented issue timelines, admin workflows, escalation concepts, and structured reporting flows.
- Currently improving authentication, database integration, and deployment architecture.

dell-e-port | *Debian Linux, Docker, Self-Hosting*

- Self-hosted media and automation services on a Debian-based home server using Docker and Git-based deployment workflows.
- Worked with Linux system administration, container management, and lightweight deployment automation.

GridSynk | *Python, FastAPI, Scikit-Learn*

- Built a prototype AI-powered microgrid coordination system for forecasting energy demand and suggesting optimized energy actions.
- Implemented demand forecasting, grid stress estimation, and explainable AI-based policy recommendations.

Scanforge (Industry-Sponsored Project)

- Selected as part of a student team for the industry-sponsored project *Scanforge: Security Code Scanner* under Resonic Industries.
- Collaborating on secure code scanning workflows, implementation planning, and project coordination.

TECHNICAL SKILLS

Languages: Python, Java, C, SQL, Bash

Frameworks & Libraries: FastAPI, Streamlit, Scikit-Learn, pandas, NumPy

Developer Tools: Git, GitHub, Docker, Linux CLI, LaTeX

Systems & Platforms: Debian Linux, i3wm, Hyprland, Self-Hosting, Basic Bare-Metal Administration

Core Interests: Systems Engineering, Backend Development, AI Integration, Workflow Automation, Linux Systems

EXPERIENCE

Resonic Industries

Nov 2025 – Feb 2026

Industry Project Contributor – Scanforge: Security Code Scanner

Pune, India

- Worked with a small external industry team on the Scanforge security code scanner project.
- Contributed to project planning, workflow discussions, and implementation coordination during the development phase.
